

CASE-01

She doesn't know what she's under-insured against.

A market analysis of Egypt's digital insurance space, and the one feature I'd build from it — an advisor that turns a description of a business into a coverage recommendation.

Low penetration isn't a demand problem.

Egypt's insurance market is growing quickly while penetration stays low. The gap is not appetite. It is **comprehension** — buyers can't tell what they need.

For SMEs the pattern is consistent: choosing coverage is complex, research takes time they don't have, products aren't tailored to their actual business risk, and traditional brokers under-serve them.

The competitive set — brokers and comparison platforms locally, plus the UAE benchmarks — all compete on distribution and price discovery. **Nobody competes on advice.**

Market context

GWP PROJECTED 2025

INSURANCE PENETRATION

Low

Compare, or advise.

Both look like the same product from the outside. They answer completely different questions.

A COMPARISON ENGINE ANSWERS

"Which of these is cheapest?" — which assumes the buyer already knows what to buy.

AN ADVISOR ANSWERS

"What do I actually need?" — the SME's real question, and the one nobody in the market was answering.

So I proposed an **AI-Powered Business Insurance Advisor**: the input is the business, not the policy. The SME describes what they do, and the system reasons from operations and assets to the coverages that fit.

What I proposed, and why.

1 • Input the business, output the coverage

A conversational intake about industry, size, activities, assets and perceived risk — then recommendations with suggested limits, not a price grid.

2 • Explain every recommendation in plain language

In a low-trust category the conversion lever is confidence, not price. Every suggestion carries its rationale in non-technical terms.

3 • Two personas set the scope

A restaurant owner and a tech founder — physical risk versus professional and cyber risk. Between them they stress the whole recommendation engine.

4 • Instrumented before it shipped

Interaction, completion, quote request, purchase and feedback rate, each with a three-month target, on a dashboard defined before the build started.

I proposed advice, not another comparison engine.

Comparison is cheaper to build, easier to explain, and already validated by every competitor in the market. It is also the wrong product for a buyer who cannot articulate what they are shopping for.

Targets, first three months

Interaction 30%

Completion 70%

Quote request 50%

Purchase 20%

Rating 4.2 / 5

What I took from it

In a low-penetration market the bottleneck is rarely price discovery — it's confidence. A product that resolves uncertainty is worth more than one that resolves price, and it is far harder to copy.

Happy to talk through the thinking —
